

ABSTRACT

A multi-compartment pill container constructed to hold a week's worth of medication for a user. The container has a housing having a top surface, a number of removable compartments held within the rectangular openings in the top surface of the housing, and a lid attached to the housing and extending over the compartments. Each compartment is divided into chambers by separation walls. Each chamber has a chamber cover on which indicia is printed. The indicia includes abbreviations for the days of the week for each of the compartments, as well as times of the day for each of the chambers. At the correct time, the user ingests the medication from the appropriate chamber. The container also includes a telescopic drinking cup to aid in the taking of medication and a timer to notify the user to take the medication. Each compartment may be completely removed from the housing to allow the user to carry the compartment separate from the entire container.
